

Abstract

The present invention relates to a device (2) for transmitting torque from a pulley (6) to a hub (10) of an assembly to be driven, in particular a compressor (4), e.g., an air conditioning compressor of a motor vehicle, with a vibration-damping element (12) located between the pulley (6) and the hub (10).

It is provided that the vibration-damping element (12) is rigidly connected at its inner circumference with the hub (10) and is engaged at its outer circumference with the pulley (6).
